Select radio button from contact page in the Date & Time Section	Completed Contact Fieldsets	Selected Radio Button changes colour	Selected Radio Button changes colour	Pass
Select radio button from contact page in the payment details section	Completed Contact Fieldsets	Drop shadow is displayed underneath	Drop shadow is displayed underneath	Pass
Press Send button at the end of Contact Page	Completed Contact Fieldsets	Composed email with the answers ready to be sent is shown	Composed email with the answers ready to be sent is shown	Pass
Press Cancel Button at the end of contact page	Completed Contact Fieldsets	Unfilled contact page is shown	Unfilled contact page is shown	Pass

Validator

I uploaded all the HTML and CSS files into the validators. While the CSS had no problems, I had some issues with my HTML code.

- When I named images in file explorer, I named them with spaces in between. This was a problem for the validator so I had to rename all of the images without a space in the name.
- Another problem I had was that initially I created <button> inside <a> that take you to other pages. The solution to this was to create a button class to links themselves, which would give them the appearance of a button.
- To apply classes to headings, I initially created <div> inside <h> and put the classes inside the div. Obviously, this is incorrect so I removed the div and applied the classes to the <h>.

Evaluation

One idea I had for my website was an animated carousel that would slide left or right when the user clicks the arrows. I do have a working carousel but without an animation. This feature would need JavaScript and since we have not covered it in class, I preferred to leave it out. The website is currently responsive when switching to smaller screens like phones or tablets, however, the layout does not always look right because some of the sections do not stay aligned. Next time I would have focused on the website staying aligned properly when scaled down. For the contact page I wanted to make the *Get in Touch* section stay at the top while scrolling down, however, I did not manage to make it work as it was not sticking in place.

For next time, I would add more interactive features. The first would be to have working social media icons in the footer that take the user to active social pages. However, these pages do not exist so I left them non responsive. Another idea I have is to create a rating system where people could give rating to pitches themselves and even leave short reviews to help others choose where to book their matches. I believe the final website looks professional with a strong base that I can build on. I learned a lot from trying new things and now I have a better idea of what I want to improve for the future.
